TrueSpec — manual phone checklist

Who runs this: the owner, on a real phone. Then a second person, on the **same phone**, with this same document. **What it is:** every interaction the code exposes, turned into one action per line, with the result the specs call correct. **What it is not:** a report. Nothing here has been run. No line has been marked pass or fail by the assistant.

Record each line as you go:

- ✓ — it did what the **Expect** column says.
- ✗ — it did something else. Write what you actually saw, and the row number, in the run log.
- ⚠ — could not be tested on this phone/account (say why).
- Leave blank — not reached.

Do not fix anything during a run. If a line fails, continue; the next line may depend on the state this one leaves.

If time is short: run **section 18** first. It is the ten lines most likely to change what you do next; the rest of the document is the full sweep.

Run record

	Run 1 — owner	Run 2 — second person
Date / time		
Phone model		
OS + version		
Browser + version		
Build / URL tested		
Signed-in office account		
Test car refs created		
Anything left over from the previous run		

Same phone, same build, same starting state is what makes the second run a repeat. Section 19 says what state to leave behind.

Before you start — test data and kit

Prepare these **before** line 0.1 where you can. P1–P4 may be existing stock; P5 is created in section 10 and tested in 11.6. The public run needs at least one complete car to look at.

#	Item	Why
P1	One **complete** car: price, at least 3 photos, all six costs, an Available state	The normal public and office path
P2	One **On-order** car with an arrival note	Reserve wording, arrival chip
P3	One **Landed** car flagged *new arrival*	Landed/new-arrival rule (BL-001)
P4	One **Sold** car with a sale price and date	Sold page, Sold filter, un-sell test
P5	One **incomplete** car: no price, no photos	The public listing gate (FN-001) — create it in section 10 and test in 11.6
P6	One filled **car template PDF** and one **enquiry sheet PDF**	Import (section 12). Fill them on a laptop before the run; the phone only uploads them. Both must be real files, not renamed images
P7	One photo **over 15 MB**, one **HEIC** photo from the phone's camera, one PDF renamed `.jpg`	Upload refusals
P8	A second browser tab, and a way to switch the phone to airplane mode	Taps, badge, offline
P9	WhatsApp installed and signed in; the phone's dialler working	Handoffs

Also note: the WhatsApp number in Settings must be a number you can open a chat with. If it is still the placeholder, section 14.2 will fail every chat line after it.

---

0. Baseline — the phone itself

#	Do	Expect	Watch for / ref
0.1	Open the site in the phone's normal browser, portrait, at default text size.	Home loads; no horizontal scrolling; nothing clipped at the right edge.	A page wider than the screen is a layout failure at 390 px.
0.2	Rotate to landscape, then back.	Layout reflows; nothing lost.	Sticky bars overlapping content.
0.3	Pinch-zoom to 200% on the home page.	Text reflows or scrolls; no content trapped under a fixed bar.	—
0.4	Check the bottom of every page for the home-indicator safe area.	Buttons and the FAB sit above the gesture bar, not under it.	iPhone: the bar must not cover the last control.
0.5	Turn the phone's text size up one step (iOS: Text Size; Android: Font size).	Text grows without overlapping or clipping.	—

1. Public chrome — every page

You should be **signed out** of the office for this section.

#	Screen	Do	Expect	Watch for / ref
1.1	Header	Tap the **TrueSpec** wordmark.	Home loads.	—
1.2	Header	Read the WhatsApp number shown.	It is the number saved in Settings, in +234… form.	Wrong/placeholder number → every chat line below is wrong.
1.3	Header	Tap the **Instagram** icon.	The shop's Instagram opens (or the icon is absent).	**Nothing happens / page jumps to top — UI-001.**
1.4	Header	Tap **Chat on WhatsApp**.	The privacy notice appears first (first tap of the page load), then WhatsApp opens with the greeting.	If the notice does not appear, or the chat opens without it — UX-007.
1.5	Header	Tap the **theme toggle**.	Dark/light flips; the icon and label match the new state.	First paint after reload flashes the wrong theme; label always says "Toggle dark mode" — UI-002.
1.6	Header	Read the **ticker**.	Up to four real lines: a landed car, an on-order car, a biggest drop, two fixed promises.	"Biggest drop" naming an on-order car — FN-008. A line naming a car that does not exist is worse.
1.7	Footer	Tap **Privacy notice**.	`/privacy` loads.	—
1.8	Footer	Tap **WhatsApp us**, then the footer's WhatsApp icon.	Same notice-then-chat behaviour as 1.4 from both controls.	—
1.9	Footer	Tap **Instagram / Facebook / YouTube**.	Each opens the shop's profile.	**Three dead links — UI-001.**
1.10	Footer	Look at the **photo gallery**.	Four cover photos from available cars; tapping one goes to that car.	Fewer than four cars → fewer tiles, no empty holes.
1.11	Global	Tap the floating **WhatsApp** button.	WhatsApp opens (after the notice, if first tap).	It must not cover a page control.

#	Screen	Do	Expect	Watch for / ref
1.12	Global	While on a loaded page, go to airplane mode and tap a link.	The offline banner appears; the page does not pretend to be fresh.	Banner timing (1.2 s) — UX section 17.

---

2. Home

#	Do	Expect	Watch for / ref
2.1	Swipe the **hero** left and right.	Slides follow the finger and stop on one slide.	Auto-advance every 5.5 s can swap the slide while reading — UI note.
2.2	Wait on the hero without touching.	It advances; it does not fight a swipe in progress.	Reduced-motion setting should stop it.
2.3	First visit only: read "**What are you after?**"	Appears once; offers SUV / saloon / other / Skip.	—
2.4	Answer "**A family SUV**".	Inventory opens **filtered to SUVs**; the URL carries the choice.	**Full, unfiltered list — UX-003 / FN-005.**
2.5	Go back, answer "**A saloon**".	Inventory opens filtered to saloons.	Same as 2.4.
2.6	Go back, tap **Skip**.	Prompt hides; it does not return on reload.	It returning every visit — UX-006.
2.7	Clear site data, reload home, tap "**See what's new**".	It either is not offered on a first visit, or explains there is no baseline.	"**New since your last visit 0 cars**" **while stock exists — FN-004.**
2.8	Scroll to the home **inventory strip**; switch Available / On order / Landed.	Cards change with the tab; an Available car flagged new-arrival also appears under Landed; counts match what is shown.	Available count says "of which N new arrivals" — BL-001; the Landed tab missing the same car — UI-004.
2.9	Tap a car card.	Its car page opens.	—
2.10	Swipe the **featured** slider.	It moves one card at a time; no vertical scroll hijack.	—
2.11	Wait 9 seconds on home.	**Nothing claims a person asked about a car.**	**A city/time/car toast appears — it is generated, not real — UX-001.**
2.12	Tap **Chat with us** in "Why choose us".	WhatsApp opens with the greeting.	—

3. Inventory — public

#	Do	Expect	Watch for / ref
3.1	Tap **Search options**.	The filter panel opens on the phone; every group is reachable.	Panel taller than the screen must scroll.
3.2	Tick **Available**, then **On order**, then **Landed**.	Each filters the list; each count matches the number of cars in that group.	Counts can include cars excluded by other filters — FN-006.
3.3	Tick a **Make**, a **Year**, a **Colour**.	Each narrows the list; counts stay truthful.	—
3.4	Enter min `5000000`, max `50000000`.	Only cars in that band remain.	—
3.5	Enter min `50000000`, max `5000000`.	A clear empty/explanation state, not a crash or a full list.	— BL-003.
3.6	Type a decimal price, e.g. `12500000.5`.	Rejected or handled visibly.	Silently truncated to `12500000` — BL-003.
3.7	Tap **Clear all filters**.	Everything resets; the full list returns; the count is announced.	—
3.8	Open **Sort by** → **Newest first**.	The **highest** `TS-####` is first.	**The lowest ref is first (oldest) — UI-005 / BL-008.**
3.9	Sort Price low→high, then high→low, then Year newest.	Order visibly changes and matches the label.	—
3.10	Switch **Grid / List**.	Layout changes; the pressed state is visible.	Grid cards omit the "Available" chip that list rows show — UI-003.
3.11	Tap a car card.	Car page opens.	—
3.12	Tap **Share** on a row.	The phone's native share sheet opens.	Falling back to "Link copied" on a phone is a clue the sheet is blocked.
3.13	Scroll to the pagination; use **Next / Prev / a number**.	One page at a time, 9 cars per page; focus moves to the heading.	Page count must match the filtered list.
3.14	Filter until nothing matches.	Empty state with a WhatsApp sourcing button.	A blank list with no explanation — fail.
3.15	Tap the empty-state WhatsApp button.	WhatsApp opens with the sourcing message.	—
3.16	Set a filter, reload the page.	The URL and the controls still carry the filter.	—

#	Do	Expect	Watch for / ref
3.17	Edit the URL to ?`status=s`.	Either the sold page or an ignored filter.	**An empty inventory with no explanation — BL-002.**
3.18	Change any filter and watch the URL.	The URL updates without a full reload.	—
3.19	Wait 9 seconds on inventory (once per session).	No fabricated social proof.	**A random-city toast — UX-001.**
3.20	Fast-flick upward from the top of the page.	"Before you go" appears only after 7 s, and at most twice per session.	Hard to trigger; note whether it appeared at all — UX-005.
3.21	Tap "**I'll keep looking**" in that modal.	It closes and the page stays usable.	Body scroll must be unlocked.
3.22	Tap the **Home / Inventory** breadcrumb.	Home, then Inventory; no dead link.	—

---

4. Car page

#	Do	Expect	Watch for / ref
4.1	Swipe the main photo left/right.	Previous/next photo, one per swipe.	Vertical scroll must not be captured.
4.2	Tap the arrows.	Same stepping.	Arrows only when more than one photo.
4.3	Tap a **thumbnail**.	Jumps to that photo; the active one is marked.	—
4.4	Tap the **main photo**.	Full-screen lightbox; page behind does not scroll.	—
4.5	Close the lightbox by the close control, the backdrop, and the back gesture.	All three close it and return to the same scroll position.	Android back must close the lightbox, not leave the page.
4.6	In the lightbox, swipe/arrow to the next photo.	Steps; does not jump back to the first.	—
4.7	Switch **Overview / Features / Delivery**.	Panel and spoken line change together.	—
4.8	Tap **Chat on WhatsApp** (sidebar).	WhatsApp opens prefilled with this car's name and ref.	Wrong car in the message — fail.
4.9	Tap **Make an offer**.	WhatsApp opens with the car and its price.	—
4.10	Tap **Book a viewing**.	WhatsApp opens with the car and ref.	—
4.11	On an **on-order** car, read the main CTA.	It says **Reserve**, not Buy/Chat.	—
4.12	Scroll until the price card leaves the screen.	The mobile bottom bar appears with price + Chat/Reserve.	It must not cover the footer or the WhatsApp gate — UI note.
4.13	Tap the bottom-bar CTA.	Same WhatsApp destination as the sidebar CTA.	—
4.14	Swipe the **related** strip.	Horizontal carousel moves one card at a time.	Heading says "More landed cars" while the strip contains on-order cars — FN-007.
4.15	Visit the same car a second time (reload counts).	Greeting changes to "Good to see you back" and offers Book a viewing.	Clear site data → the message resets — UX-006.
4.16	Tap **Share this**.	Native share sheet with the car URL.	—

#	Do	Expect	Watch for / ref
4.17	Open a **sold** car's link from a chat.	"That one found a new owner", similar available cars, a **Message Umar** button and a **See the full inventory** link; not a 404.	Both controls work.
4.18	Open `/car/TS-0000` (a ref that cannot exist).	The real 404 page.	A blank page or a 500 — fail.
4.19	Open a car with **no photos**.	Drawn placeholder, no counter/arrows/thumbs; page still works.	Broken-image icon — FN-002 (only if data is bad).
4.20	Wait 9 seconds on the car page (new session).	No fabricated social proof.	Random-city toast — UX-001.
4.21	Load an **on-order**, a **landed** and a **special** car; read the greeting line.	The wording changes with the car's state; an arrival month is named only when the note carries one.	The same generic line for every state — fail.
4.22	On a car page, after 7 s, fast-flick upward from the top.	"Before you go" with WhatsApp + "I'll keep looking".	Unreachable — UX-005.
4.23	Only if bad data exists: open a page whose photo row is not a valid asset id.	The drawn placeholder; the page still loads.	**A crash instead of a placeholder — FN-002.** Mark ⚠ if you cannot create the row.

---

5. WhatsApp handoff and the tap record

Do 5.1–5.3 once on a car page and once on the home header. The tap they create is then checked in 5.4–5.6 **after you sign in** (section 7); the record survives the sign-in.

#	Do	Expect	Watch for / ref
5.1	Tap a WhatsApp button for the **first time in a page load**.	Privacy notice appears **before** the handoff; only after accepting does WhatsApp open.	The WhatsApp app opening behind the notice — fail.
5.2	Dismiss the notice, then tap the same button again.	It opens directly; the notice does not repeat in that page load.	Reload → it appears again (once per tab) — UX-007.
5.3	Send the prefilled message, then press the phone's back gesture to return.	The browser is still on the car page, at the same scroll position.	Returning to home instead — fail.
5.4	In the office, open **Enquiries → Taps**.	The tap is listed with page, car ref and time. **No name or phone number.**	Any PII in the tap list — fail (spec).
5.5	Tap the shell's WhatsApp badge (or dashboard "All taps").	Opens the Taps panel; the badge clears after the list is viewed.	Badge must stay at zero, glyph remains.
5.6	Go back to the dashboard.	The "new" count is 0; the glyph is still there.	A popup/sound — not built, not expected.

6. Privacy and legal

#	Do	Expect	Watch for / ref
6.1	Open `/privacy` and read the top.	A real privacy notice: who, what, why, how long.	**An "Owner note" saying this is a demo notice — UX-002 (blocker).**
6.2	Scroll to "**Who to contact**".	A working contact route.	**No email address anywhere — UX-004.**
6.3	Scroll to "**Your rights**".	It names a way to request deletion that actually exists.	The product has no delete path at all — DATA-002 / COV-001.
6.4	Tap the WhatsApp contact on the page.	Opens a chat.	—
6.5	Check the **last updated** date.	It is a real date, not a placeholder.	—

---

7. Office door and shell

Sign in with the owner account.

#	Do	Expect	Watch for / ref
7.1	Signed out, open `/office`.	Redirects to `/office/sign-in`; Clerk's sign-in appears inside the office look.	A public sign-up link — there should be none.
7.2	Sign in with the correct password.	Lands in the office (dashboard).	—
7.3	Open `/office/sign-in` while signed in.	Redirects to `/office`.	—
7.4	Read the **bottom nav** at 390 px.	Dashboard / Inventory / Enquiries / Drafts / Activity (or More) all fit; labels are not clipped.	Any item pushed under the home indicator.
7.5	Tap each bottom-nav item.	Correct screen; the current item is marked.	A dead item — fail.
7.6	Open **More** (if present).	Settings and Account reachable.	—
7.7	Tap the **topbar WhatsApp badge**.	Opens `/office/enquiries?tab=taps`.	—
7.8	Tap the **account chip**.	`/office/account`.	—
7.9	Tap **Sign out**.	Returns to the door; the office refuses on the next request.	Device drafts should be cleared (test in 16.7).
7.10	Press the phone's back gesture after sign-out.	Does not restore a signed-in office page.	A cached office page visible — fail.
7.11	Optional, only if you can recover the account: at sign-in, enter a wrong password 10 times.	A bounded lockout (spec: 30 min), never indefinite.	**No lockout is implemented in the app — SYS-001 / COV-003. Record what Clerk actually does; do not lock yourself out if recovery is unclear.**
7.12	Open an office URL that cannot exist, e.g. `/office/nonsense`.	The office not-found page, with a link back to the dashboard.	A blank page or the public 404 — fail.

---

8. Dashboard

#	Do	Expect	Watch for / ref
8.1	Read **Money tied up**.	A naira total and the number of cars it covers, including cars with incomplete costs.	A figure that silently omits incomplete cars — fail.
8.2	Read **Projected profit**.	A total, "From X of Y cars", and "N excluded: costs incomplete".	A profit that includes an incomplete car — BL-006.
8.3	Read **Real profit (sold)**.	Sold cars only; sale price minus cost.	—
8.4	Read the counts strip.	Available / On order / Landed / Sold, with "of which N new arrivals" where present.	**BL-001:** a new-arrival Available car appears under Landed but is missing from the count.
8.5	Tap a count card.	Inventory opens filtered to that state.	A link that lands on the unfiltered list — fail.
8.6	Read **Recent activity**.	Car/enquiry/setting subjects and times; car refs open the car.	—
8.7	Tap **Full log**.	Activity opens on the same entries.	—
8.8	Read **Recent WhatsApp taps**.	Page / car / time only. **No phone numbers or names.**	Any PII — fail (spec).
8.9	Tap a tap's car ref.	The car form opens.	—
8.10	Switch to another app for ~10 s, return to the dashboard.	Figures refresh on focus; there is no Refresh button.	Stale figures after a change made in another tab — E10.
8.11	In a second tab, add a car. Return to this tab.	Counts and money update on focus.	—
8.12	Tap **Add a car**.	The car form opens.	—

9. Office inventory

#	Do	Expect	Watch for / ref
9.1	Type a **ref**, then a **model name**, in Search.	Each narrows the list; the placeholder says "name or ref".	It matching neither, or only matching the start of a ref — fail.
9.2	Open **Sort → Newest first**.	Highest `TS-####` first.	**Oldest first — UI-005 / BL-008.**
9.3	Sort by price high→low, low→high, profit high→low.	Order matches the label; cars with no price/profit sort predictably.	A crash on a null profit — fail.
9.4	Change **page size** to 10, then 50, then 100.	Row count changes; the page resets safely.	—
9.5	Reload.	The page size persists.	It should (localStorage).
9.6	Tap each **state chip**, including **Sold**.	Only that group; the chip's count matches the rows.	Zero-count chips hidden unless active.
9.7	Tap a row's **Edit**.	The car form opens.	—
9.8	On a test car, tap **Delete**.	A confirm dialog that **names the car**.	A generic "Are you sure?" — fail.
9.9	Confirm.	The row disappears; an **Undo** offer appears for 8 s.	No undo — fail.
9.10	Tap **Undo** within 8 s.	The row returns; nothing is left in the clear-out list.	—
9.11	Delete again and wait 10 s.	The row is gone from the live list; it appears in the **clear-out** list as a tombstone.	It vanishing entirely — fail.
9.12	Open the **clear-out** list and tap **Remove for good**.	An explicit confirm naming the car; then it is gone permanently.	One-tap permanent delete — fail. Only deleted cars are listed; enquiries at their year and orphaned files have no surface here — DATA-003 / COV-004.
9.13	Filter until nothing matches.	Empty state with **Clear filters**.	—
9.14	Use pagination.	One page at a time; the current page is marked.	—
9.15	On the phone, check every row action.	Edit and Delete are visible, not hover-only.	An action only reachable by hover — fail at 390 px.

#	Do	Expect	Watch for / ref
9.16	Tap the **Car template** link.	A blank PDF downloads (or opens in the phone's viewer).	**iOS Safari may open it instead of downloading — record which.**
9.17	Tap **Create from file**.	The file picker opens; both a car template and an enquiry sheet are accepted.	—

---

10. Add a car

Use a clearly marked test car; write its ref in the run record.

#	Do	Expect	Watch for / ref
10.1	Tap **Add a car**, then **Save car** with everything empty.	Field messages appear; focus moves to the first invalid field.	A save with no make/model/year/state — fail.
10.2	Enter a year of `1800`, then `3000`.	Refused with a range message (spec: 1900..next year).	—
10.3	Enter a mileage of `-5`, then `12.5`.	Refused; whole number only.	—
10.4	With make/model/year/mileage/state filled, leave **price** blank and save.	Allowed (an office-only car).	The car must not appear publicly — test 11.6.
10.5	Add a photo from the **camera**.	Uploads; thumbnail appears.	The phone's camera permission prompt.
10.6	Add a **HEIC** photo from the library.	Accepted, or a clear refusal that names the format.	A silent failure — fail.
10.7	Add the **>15 MB** photo.	Refused before upload with a 15 MB message.	A long spinner then a generic error — fail.
10.8	Add the **PDF renamed `.jpg`**.	Refused as not an image.	It being accepted — fail.
10.9	Add three photos, then tap **Make cover** on the third.	It moves to first; the cover marker follows.	—
10.10	Remove the second photo.	It disappears from the list.	Any confirm/delay is worth noting.
10.11	Fill all six costs.	The total and the live profit update while typing.	A stale total until save — fail.
10.12	Set a price, then enter costs that exceed it.	A **negative** profit with a minus sign.	Clamped to zero or hidden — G8.
10.13	Choose a primary state; tick two secondary states.	Exactly one primary; secondaries multi-select.	Two primaries selectable — fail.
10.14	Add an **arrival note** and a **private note**.	Both saved.	The private note appearing publicly — check 10.17.
10.15	Tap **Save car**.	A toast names a new `TS-####`; the showroom updates.	An error — write it down.

#	Do	Expect	Watch for / ref
10.16	**Immediately tap Save car again.**	Nothing else is created; the form is no longer able to create a second car.	**A second `TS-####` with identical details — FN-009 / BL-010 (major).**
10.17	Open the new car's public page.	It shows the price, photos, features, arrival note. **Not** the private note or costs.	A private note or cost on the public page — blocker.
10.18	Check the public inventory includes it.	It appears in the right section with the right price.	—
10.19	Return to the form.	No duplicate; the ref is final.	—
10.20	Type into the form, then close the tab without saving. Reopen **Add a car**.	The device draft restores the fields and photos; a line says the draft is kept.	Silent loss — fail; a prompt is not expected, auto-restore is. The draft includes private notes and costs — DATA-006.
10.21	Type into the form, then tap **Cancel**.	A question before discarding, or the work is kept.	**Cancel clears the device draft with no question — UX-008.**
10.22	Type into the form, then press the **phone's back gesture**.	The work is still recoverable (device draft).	—
10.23	Tap **Autofill from PDF** with a filled template.	Fields fill; **no photos are added**; a notice names what was filled.	Photos invented — fail.
10.24	With values already typed, autofill again.	**Replace / Keep** is offered; both do what they say.	It silently overwrites — fail.
10.25	Tap **Manage states**.	Opens Settings' car-state editor.	—

---

11. Edit, sell, un-sell, delete, and the public gate

#	Do	Expect	Watch for / ref
11.1	Open a car; read its **reference**.	It is visible and not editable.	An editable ref — fail.
11.2	Change the price; save.	"Saved" or "Nothing changed." as appropriate; the public price follows.	A save that claims success while the value did not change — fail.
11.3	Open a car and tap **Mark as sold**.	Sold is chosen; sale price and date are asked for.	Nothing is written until Save — check.
11.4	Enter the sale price and date; save.	Inventory → Sold; the public page becomes the sold page.	—
11.5	Un-mark Sold and save.	It returns to the **previous primary state**; secondaries untouched; counts agree.	It returning to a default Available — BL-005 / G11.
11.6	Create/keep the **incomplete** car (no price, no photos). Open `/car/<its ref>` in a new tab.	**404** — a car without a price and a photo is office-only.	**It renders at ₦0 with a placeholder — FN-001 (blocker).**
11.7	Delete a car and let the undo window close.	It is a tombstone; removing it for good clears its photos/costs/sale.	—
11.8	After removing for good, open its old public URL.	404.	A stale page — fail.
11.9	On a test car with a **was-price**, raise the current price above it; save; open the public page.	The Special ribbon and the struck-through price are gone together.	The ribbon vanishing while the was-price remains in the record — BL-004.

12. Import and drafts

#	Do	Expect	Watch for / ref
12.1	In **Enquiries**, tap **Enquiry template**.	A blank PDF downloads/opens.	—
12.2	Tap **Create from file** and choose the filled **enquiry sheet**.	A batch of drafts is created; the count is stated.	An enquiry created directly — fail (a draft is not a record).
12.3	Choose a **wrong file** (e.g. a photo).	A named refusal; nothing is created.	A silent no-op — fail.
12.4	Choose a file **over 10 MB**.	Refused with the 10 MB rule.	Upload starts then fails — fail.
12.5	Open **Drafts**; read the batch.	One card per row; fields the file did not carry say so.	—
12.6	On a car draft, tap the **state** select.	A primary can be chosen; the file's original state is marked.	—
12.7	Choose a state when the file's state was deleted.	The red "which is gone — choose one" warning clears once a replacement is chosen.	**It stays — UI-008.**
12.8	Add two photos to the draft; make the second the cover.	Uploaded, survive a reload, cover marked.	—
12.9	Reload the drafts page.	Photos and choices are still there.	—
12.10	Tap **Save as a car** on a draft with no state.	Refused: choose a state.	A car created with no state — fail.
12.11	Choose a state and save.	A `TS-####` is minted; the draft leaves the list; the car appears in Inventory.	—
12.12	On another draft, tap **Delete**.	An explicit confirm; deletion is permanent (no undo is expected).	—
12.13	After saving an enquiry draft, open the enquiry and look for a control to open the **imported PDF**.	The PDF is linked to the enquiry and can be opened or deleted by the owner.	**No such control exists — DATA-001.** Record the absence.
12.14	Open a car draft and tap **Cancel**.	Returns to Drafts; the draft row is still waiting.	—
12.15	Use **Save as draft** in the car draft editor, then in an enquiry draft editor.	Both keep the draft waiting; incomplete fields allowed; nothing is created.	—

#	Do	Expect	Watch for / ref
12.16	Tap **Edit** on a car draft and on an enquiry draft.	The full editor opens, prefilled from the file, in draft mode.	—
12.17	With no drafts waiting, open Drafts.	An empty state that says so.	A bare page — fail.
12.18	On a draft with photos, tap **Remove photo**.	The reference leaves the draft; the rest survive a reload.	—

---

13. Enquiries and taps

#	Do	Expect	Watch for / ref
13.1	Open **Enquiries**.	A board of columns, one per customer state; cards are readable at 390 px.	Horizontal scrolling must be obvious; a card cut in half — note.
13.2	Tap a card.	A detail dialog opens with the customer.	The dialog must fit and scroll.
13.3	Tap the **phone** number.	The dialler opens with the number.	—
13.4	Tap **WhatsApp them**.	WhatsApp opens with the customer's number and a message naming their ask.	Wrong number — fail.
13.5	Tap **Call**.	Dialler opens.	—
13.6	Tap **Edit**.	The enquiry form opens with every field.	—
13.7	Change a field and save.	"Saved"; the board reflects it.	—
13.8	Save again with no change.	"Nothing changed."	—
13.9	In the detail dialog, tap a **different state pill**.	The state changes; a toast says the cars are untouched.	**It commits on one tap with no confirm/undo — UX-009.**
13.10	Tap the **same** state again.	No misleading "moved" message; no duplicate work.	—
13.11	Look for a **Delete / Remove** control.	The spec's retention deletion exists somewhere.	**Nothing anywhere — DATA-002 / COV-001 (blocker).**
13.12	Switch to **Taps**.	Full tap list, newest first, page/car/time only.	Any PII — fail.
13.13	Scroll the taps list on the phone.	Readable; no horizontal overflow.	—
13.14	Tap a car name in Taps.	The car form opens; if the car is gone, it says so rather than 404ing.	—
13.15	Create an enquiry with **Create from file** and check the board.	It lands as a draft, not an enquiry.	Direct entry — fail.
13.16	Edit an enquiry, change a field, then tap **Cancel**.	Returns without saving; the board is unchanged.	Check whether it asks before discarding.

13b. Activity log

#	Do	Expect	Watch for / ref
13.17	Open **Activity**. Type a ref, a word from an action, and an actor in **Search**.	Each narrows the log.	The placeholder says "car, ref or action"; search must cover all three.
13.18	Tap each **type chip** (All / Cars / Enquiries / Money / Settings).	The list filters; each chip shows a count.	Counts that include entries the filter hides — note.
13.19	Filter until nothing matches, then tap **Clear filters**.	The empty state explains and the reset restores the full log.	—
13.20	Tap a **car ref** in the log.	The car form opens.	Only car subjects link; an enquiry subject is text.

---

14. Settings — contact and defaults

#	Do	Expect	Watch for / ref
14.1	Open **Settings**.	Sub-menu: General / Car states / Customer states / Account.	Tabs must not overflow at 390 px.
14.2	Enter a valid Nigerian number; save.	"Valid"; every chat button follows; the stored value is normalised.	—
14.3	Enter an invalid number.	Save refused; the old number stays in force; an inline reason.	An invalid number saved — fail.
14.4	While typing an invalid number, read the **preview link**.	It matches the number on screen.	**It keeps the last valid link — UX-011.**
14.5	Read the **Owner** note beside the field.	It reads as advice, not as "this is a demonstration".	**"The demonstration ships with a placeholder number" — UX-010.**
14.6	Change the **tagline** to 80 characters; save.	Saved; the home page follows.	More than 80 refused with a counter.
14.7	Save a tagline identical to the current one.	"Nothing changed."	—
14.8	Change the **full-tank default**; save.	Stored; a new car's empty-tank cost prefills.	—
14.9	Type into a card, reload without saving.	The device draft restores the value and marks it unsaved.	—
14.10	Check each card's **audit line**.	Names who changed it and when.	—

15. Settings — states

#	Do	Expect	Watch for / ref
15.1	**Car states**: read the four locked primaries.	They are in the showroom order, marked locked, not editable.	The order is what the showroom groups by and cannot be corrected here — BL-011.
15.2	Add a **secondary state**.	A new row appears, focused, named "New state".	—
15.3	Rename it and leave the field.	The name commits; a duplicate name is refused and the old name returns.	—
15.4	Open the **colour picker** and choose a colour.	The swatch and label ink update.	iOS/Android native picker; does the change commit on close?
15.5	Press and hold the **grip** and drag the row.	The row moves.	**Touch drag does not fire; no arrow keys on a phone — UI-006 (major).**
15.6	With an external keyboard connected (optional), press ↑ / ↓ on the grip. Without one, look for any other reorder control.	The keys move the row; the phone alone offers no other control.	**No reorder is possible on the phone — UI-006.**
15.7	Tap **Delete** on an **unused** state.	A confirmation.	**It disappears immediately — UI-007 / BL-009.**
15.8	Tap **Delete** on a state a car uses.	Refused with a count/explanation; nothing changes.	—
15.9	**Customer states**: repeat 15.2–15.8.	Same behaviour, all rows editable.	Same touch/no-confirm issues.
15.10	Give two customer states the same colour.	Allowed or refused consistently; the board stays readable.	—
15.11	Reload after each change.	Every change persisted.	A change lost on reload — fail.

16. Account, export, sign-out

#	Do	Expect	Watch for / ref
16.1	Settings → **Account**.	The Clerk account panel.	—
16.2	Tap **Change password**.	Clerk's own flow; the office never holds the password.	An in-app password form — fail.
16.3	Tap **Back to the office**.	Returns to Settings.	—
16.4	Tap **Download the export**.	One ZIP; it contains `master.json`, one CSV per subject, `README.txt`.	**iOS: record whether it downloads or opens. A ZIP with no CSVs — fail.**
16.5	Read the **System** card.	Storage and backup reported honestly, or "not reported".	Permanently "unknown" unless an external job exists — SYS-006 / COV-002.
16.6	With a device draft present, **sign out**.	Returns to the door.	—
16.7	Sign in again; open the car/draft you left.	The device draft is **gone** (sign-out clears it).	It surviving sign-out on a shared phone — privacy finding.
16.8	In two tabs, sign out in one; use the other.	The other refuses on its next request.	A stale tab still saving — fail.
16.9	Press back after sign-out.	No office page is restored from cache.	—

17. Offline, slow network, and limits

#	Do	Expect	Watch for / ref
17.1	On a loaded public page, go to **airplane mode**, then tap a link.	The offline banner appears; no fake freshness.	—
17.2	In the office, go offline and open a car form.	The banner appears; **Save controls are disabled**; a line explains.	A Save that appears active and fails on tap — fail.
17.3	Type into the form while offline, then restore the network.	The recovery line says the draft is still here and to press Save.	The draft being lost — fail.
17.4	Press Save after restoring.	Saves once; no duplicate (see 10.16).	—
17.5	Open the same page in a second tab; make a change in one; focus the other.	The office refreshes figures on focus; the public page does not claim to be live.	—
17.6	Kill the browser and reopen the office.	A still-valid session lets you in; an expired one returns to the door, not a blank error.	—
17.7	Try adding a photo with the **image store unreachable** (if you can simulate it).	A named failure ("picture store could not be reached"); the form keeps its values.	A silent failure — fail.
17.8	Check the phone's **share sheet** and **file picker** never open a blank sheet.	Native controls list the expected apps.	—

18. The blocker and major checks, in one place

If you only run ten lines, run these. They are the findings most likely to change what the owner does next.

#	Finding	One-line reproduction	Expected by the spec
B1	**FN-001** unlisted car at ₦0	Clear a car's price and photos, save, open `/car/<ref>`	404
B2	**UX-002** demo notice on the live site	Open `/privacy`	A real notice, no owner note
B3	**DATA-002 / COV-001** no deletion	Open any enquiry	A remove/retention path exists
B4	**FN-009** double-save creates two cars	Save a new car twice	One car
B5	**UI-005 / BL-008** "Newest first"	Public and office inventory	Highest ref first
B6	**UI-006** state reorder on touch	Drag a grip on the phone	The row moves
B7	**UX-001** fabricated social proof	Wait 9 s on home	Nothing untrue
B8	**UX-003** body filter	Home → "A family SUV"	A filtered inventory
B9	**UI-001** dead social links	Tap Instagram	A profile, or no icon
B10	**UX-008** Cancel discards work	Type, tap Cancel	A question, or work kept

19. Hand-over to the second person

After the owner's run, leave the phone and the account in this state, and write it in the run record:

1. **Signed out** of the office, or signed in with the test account — state which.
2. The **test cars** from P1–P5 are still present, with their refs written down. Do not delete them between runs.
3. One **draft** is left waiting in Drafts (so 12.5–12.9 can be repeated).
4. One **enquiry** is left on the board, with a phone number that is safe to dial.
5. The **WhatsApp number** in Settings is the real test number, not the placeholder.
6. Site data is **not** cleared between runs unless a line says so; the second run is about repeating the same actions, not resetting the world.

The second person runs the same sections in the same order and records only **differences** from the owner's run, plus anything the owner marked ⚠.

What "repeatable" means here: the same action on the same build produces the same result. A line that passed for the owner and fails for the second person is a finding about the **phone's state**, not necessarily about the code — record the state (signed in/out, draft present, network, site data) before calling it a defect.

---

20. What this checklist does not cover

- **Desktop-only behaviour** (hover, keyboard navigation, drag-and-drop with a mouse) — the standing browser-check procedure covers those widths, not this document.
- **The 12-hour idle / 7-day session expiry** — not practical to wait out. The session rule is in the code and in `session-rules`; test only the signed-out and sign-out paths here.
- **The database, the image store, Clerk's dashboard, the backup job** — read-only this pass. Where a result depends on them, the line says so.
- **Load, abuse and rate limiting** — the tap endpoint has no limit (SYS-003); this is an edge/deployment check, not a phone one.
- **The 12-hour expiry and the daily job** — not observable in one sitting; check the System card for what the deployment reports (16.5).
- **An induced server error** — the office error boundary exists (`app/office/error.tsx`), but a phone run cannot make a read fail safely. Mark ⚠ if you cannot induce one.
- **A malformed photo row (FN-002)**, **money precision (BL-007)**, the **dead `getPublicCar` path (FN-003)**, **row-level security (DATA-004 / SYS-004 / COV-006)**, **single-owner enforcement (DATA-005 / SYS-002 / COV-005)**, **session expiry (SYS-005)** and **rate limits (SYS-003)** — database and deployment checks, not phone ones.

---

21. Deviation log

Write one line per row that did not match. Do not summarise — the row number plus what you saw is what the next person needs.

Row	Run	What actually happened	Looked like	Screenshot?

"Looked like" is your first read, not a diagnosis: wrong number, missing control, slow, crashed, opened the wrong app, text clipped, nothing happened. Keep it to those words.
